

PHP *Word*

PHPWord is a pure PHP library for reading and writing Word, ODT, and RTF files. This file is the source file to test the read/write capabilities of [PHPWord](#).

It can ~~even~~-read track changes.

PHPWord can apply font formats such as **name and size**, **bold**, *italics*, **color**, underline, ~~strikethrough~~, ~~double strikethrough~~, small caps, ALL CAPS, _{subscript}^{superscript}, or **highlighted**. You may also notice that there's one text break (empty paragraph) before this one that can be created also by PHPWord ¹.

PHPWord can also format paragraph such as this justified, 12pt before and 12pt after with 1.5 lines spacing paragraph. This formatting can be applied inline or using predefined style as we use to do in Word.

PHPWord can also create multicolumn paragraph which is treated as a new section with continuous break type. We can define either the number of columns or spacing between the columns.

Lists

PHPWord can create bulleted lists ...

Point 1

Point 2

... and numbered lists too.

One

Two

with

bold

Three

Tables

Tables are also easy to be made by using PHPWord.

A ²	B ³	
	C	D

Images

PHPWord can insert images in your documents.

End note

Colspan
